Cleaning Strawberries

We are pleased to inform the public that for this season (approximately the next 6 weeks) Quebec strawberries may be used, once the following procedure has been carried out. The following procedure should be carried out with a maximum of 20 strawberries at a time.

1. The green stem of the strawberries should be cut off, leaving the remainder of the strawberry whole.

2. These strawberries should then be soaked for 4 minutes in a solution of water using three tablespoons of quality dishwashing liquid, e.g. Palmolive, sunlight, to a liter of water. Whilst the strawberries are soaking in this solution, each one should be rubbed individually.
3. These strawberries should then be washed under running water, whilst rubbing each strawberry and ensuring that the soap has been removed.
These strawberries are now ready to be eaten.
